The tilt-table test is a simple, inexpensive, and informative test that can help identify the causes of fainting. As its name implies, the tilt table test involves placing a patient on a table with a foot-support, then tilting the table upward. The tilt-table may start off in a horizontal position and be tilted by degrees to a completely vertical position. The patient's blood pressure, pulse, and symptoms are monitored throughout the test.

Appointment : Noninvasive Cardiovascular laboratory, Bhumisiri Bld. FL. 4

Note: MD referal/order form is required before the appointment.
